

Stretchy Slime

This is a super-fun recipe to try. This gloopy stuff is the basis for many more awesome slimes later in the book.

YOU WILL NEED

- 240 ml (8 ½ fl oz) PVA glue
- 1 tsp bicarbonate of soda
- finger paint or food colouring of your choice
- 1 tbs eyewash - it must contain boric acid or sodium borate

TIME:
10 MINUTES

DIFFICULTY:
EASY

WARNING:
NON-EDIBLE

1

Pour the glue and bicarbonate of soda into your bowl. Beat together.

2

Squirt in some paint and stir well. Keep adding more paint until you get the perfect colour.

3

Drop in the eyewash and mix together. The slime will begin to get stringy. When it comes away from the edges of the bowl, knead or squish the mixture with your hands.

SCIENCE BIT

Glue is made of long molecules (groups of atoms) called polymers. When glue and eyewash are mixed, the polymers stick together. This turns glue from a liquid into a bouncy, stretchy solid.
